Torrentmatrioshkitemporada2. Are you a fan of the latest technological. This invention relates to a circuit for detecting the deterioration of a member mounted in a vehicle or the like and, more particularly, to a circuit for detecting the deterioration of a member, such as a battery or an electric motor, by detecting the voltage level of the member. In a system for detecting the state of deterioration of a member mounted in a vehicle or the like, it is necessary to detect the voltage level of the member by performing measurement in the operating state thereof. To do this, a circuit for detecting the voltage of a battery has been employed as a circuit for detecting the deterioration of the battery. A battery voltage level detector of the type as described above is disclosed in Japanese Patent Laid-Open No. 62-236549, for example. This conventional battery voltage level detector detects the voltage of a battery connected to an electric power steering apparatus mounted in a vehicle. The detection of the battery voltage level is performed as follows. First, a first input terminal connected to the battery is set at a fixed potential determined to keep the temperature rise due to the input of current therethrough to an acceptable level. Then, the first input terminal is connected to a current source, and a current is made to flow through the current source in accordance with the magnitude of the potential at the first input terminal. The current flowing through the current source is detected by a voltage detecting circuit, and the detected current value is compared with a predetermined reference current value. The battery is determined to be deteriorated when the detected current
