East Germany is going to cap the amount of power its citizens use at 350 watts. That's equal to what you get from a standard light bulb, or two light bulbs on a dimmer. West Berliners will be able to keep on using their old power supplies as they were before. The move by the East German government is meant to cut energy costs, but it's also kind of giving back a little. This story first appeared on our sister site, The Next Web. Microfluidic devices and technologies that utilize them are widely used in many modern day applications. These include, but are not limited to, chemical analyses, cell handling, molecular analysis and DNA amplification. The rapid development of the field of microfluidics owes much to advances in fabrication techniques and technologies. An example of an advanced fabrication technique is aqueous based soft lithography which combines aqueous based polymers and inorganic surfaces. This technique enables a variety of structures to be made in aqueous conditions in a conventional plastic mould. The mould can be, for example, a silicon wafer, a glass plate or a metal mould. Other features of the present embodiments will be apparent from the accompanying drawings and from the detailed description that follows. they went and had some cotton candy!
