If I use a for loop with isConvertibleTo to convert each item in the List to a type I will run into the following exception: Exception in thread "main" java.lang.ClassCastException: [Ljava.lang.Object; cannot be cast to [Lorg.reflections.Reflections; What would be the best way of converting my List of classes to my List of types? A: If you have a static List and all classes are instances of a common base class, you can use Java Reflection API to get the generic type of the List, and then obtain the list of all types of the common base class by using Class.forName, and finally iterate over all these types to

obtain the list of all types of all derived classes: // assuming you have the list as a List ca3bfb1094
