Describe your tasks With TimeTrace, you can record information related to your daily tasks in just a few seconds. As soon as the task starts, you can track the time spent on it, and if you prefer, you can log a list of all the tasks that you perform in the current period. The application allows you to create tasks that repeat themselves on a daily, weekly or monthly basis, so that you can keep on tracking your time. Plan your tasks for the coming months You can choose whether you want to see the time data in the form of a graph, or as a list of individual tasks. The graph shows the time spent on the tasks, while the list can be filtered to show certain records at a time. The information can be downloaded to any file and exported into an HTML document, or you can view the activities on a monthly or yearly basis. You can also share the information with your family and friends, so that they can also plan their own activities using your time records. Customize the time tracker As with any time tracking software, you can customize TimeTrace to fit your preferences. The user interface is very flexible, and you can change the font and layout to suit your needs. You can change the skin of the application and experiment with other layouts. You can even change the date formats, and remove entries from the list with a click. Customize TimeTrace with these features: Change the TimeTrace user interface skin and layouts Remove some of the tasks Add new tasks to repeat on a daily or monthly basis Generate a weekly, monthly or yearly list of all activities. Ladybug Motion 2D is a Java-based program that illustrates how velocity and acceleration vectors behave when a ladybug is in motion. It is very intuitive, and you are allowed to control every parameter yourself. Control the ladybug's position, velocity and acceleration Next, you might want to step it up and control the ladybug's motion yourself. To do this, you need to select Manual motion and the parameter you wish to control. In the tiny Remote Control window, you can click the mouse at various points to impart motion or acceleration, as well as start moving the ladybug in a specific direction. Record the ladybug's motion for later analysis If you've come up with a particularly interesting simulation, you can capture the movement and play it back later. This is especially helpful if you need to explain certain concepts to a large number of students several times. In short, Ladybug Motion 2D is a great tool for those trying to learn about motion vectors, as well as teachers who want to explain these concepts. You can set up the simulation in seconds, and it is very easy to understand. LearningSoup is a free resource for educational purposes. Ladybug Motion 2D

This is a full-featured program that simulates the movement of a ladybug in 3D space. You can freely move the ladybug anywhere in 3D space, or you can trace it with a line. The ladybug can accelerate or decelerate, and you can modify the ladybug's position in the system's coordinate system. The ladybug is influenced by gravity, spring forces and friction forces. All of these aspects of the ladybug's motion are controllable from the system's configuration window. The following illustration shows the Ladybug Motion program. Click the image above to view image on the product's web page The Ladybug Motion 2D Description! In Ladybug Motion 2D, you can: • Set up simulations in just seconds! • Move in 3D space freely in a realistic way • Define the spring constant and friction constant • Change the parameters affecting the ladybug's movement • Evaluate the ladybug's speed or acceleration • Record the whole session for later review • Play back the session in real time • Analyze motion vectors, such as the velocity and acceleration vectors Furthermore, you can: • Transform a 3D object into a 2D object • Trace a path or vector in 2D space • Move the ladybug around any of the 2D/3D space combinations • Analyze motion vectors Ladybug Motion 2D is ideal for anyone who wants to learn about the behavior of velocity and acceleration vectors, as well as the associated notions of speed and acceleration. Ladybug Motion 2D can be used to teach and illustrate various aspects of the physics world. It can be used in physics courses, particularly in any courses dealing with classical mechanics, or courses dealing with force and friction. Using Ladybug Motion 2D, students can easily grasp the concept of motion vectors and accelerate/decelerate the ladybug in just seconds! Features in Ladybug Motion 2D: • Authentic 3D ladybug simulation • Elastic spring constants and friction constants • All parameters are adjustable • User-defined path and vector analyses • Realistic 3D graphics, high FPS • Simulations are recorded so you can play the simulation back later • Playbacks are in real time. Playback is not included in the purchase price • Several simulation types • Learn about acceleration and velocity vectors • Learn about distances and dimensions. Movement in the Realistic 3D space is easy to

Ladybug Motion 2D is a Java-based program that illustrates how velocity and acceleration vectors behave when a ladybug is in motion. It is very intuitive, and you are allowed to control every parameter yourself. Analyze velocity and acceleration vectors To begin with, you should probably select one of the three types of motion the program can simulate automatically. While the ladybug is moving in a line, circle or ellipse, you can see the forces at work. You can hide the velocity or acceleration vector if you aren't interested in one of them, and the ladybug's path can be traced with a line or dots. Control the ladybug's position, velocity and acceleration Next, you might want to step it up and control the ladybug's motion yourself. To do this, you need to select Manual motion and the parameter you wish to control. In the tiny Remote Control window, you can click the mouse at various points to impart motion or acceleration, as well as start moving the ladybug in a specific direction.
